

## **Great California Drone Debate Vision Statement:**

Goal: To inform the public about the consequences surrounding instituting Drone policy by forming a coalition of schools to facilitate a debate in a public forum style on the topic of drone policy. This project intends to reach multiple constituent areas in the state of California as a moderation group for the debate, so as to foster a large and diverse statewide response to the debate forum and a conducive environment to beneficial debating.

*To reach this goal our team intends to take the following steps:*

- Constructing and delivering a grant proposal to NASA in order to secure funding for technological infrastructure, subsequent events, meetings, the creation of a droneoriented online public forum and tertiary logistical items.
- Forming a multilateral group of student associations from target constituent areas. (These groups would have a vested interest in drone legislation and would act in a coalition for the moderation of the online public forum)
- Constructing a website to host the online public debate and to inform the California public on the issues surrounding the drone debate with respect of the opinions from every constituent area.
- Increasing public awareness and education on the drone issue by way of student involvement, media outlets and the creation of a possible webinar series to inform: both interested debaters and the general public.
- Moderating the online debate forum and preparing evidential material for every possible opinion represented in the debate. (This procedure intends to allow all opinionated California citizens the

ability to have their say in the debate and to interpret any evidence in innovative ways.)

- Organizing the results of the aforementioned online debate into data that can be later used for drone legislation and drone education.

*After successfully completing this goal our group intends to further our purpose by:*

- Compounding the results of the online public forum into a piece of grouplegislation that targets the regulations and procedures of drone ownership and operation.
